

Whitepaper: BENS OMS & BENS OMS Panel for SAP Systems

Intelligent Output Management for SAP-Systems

BENS OMS is a powerful, SAP-certified solution for optimising printing processes in complex SAP landscapes. In conjunction with the BENS OMS PANEL – an intuitive, web-based user interface – the system enables simple, centralised and efficient management of printer fleets – without the need for in-depth SAP knowledge.

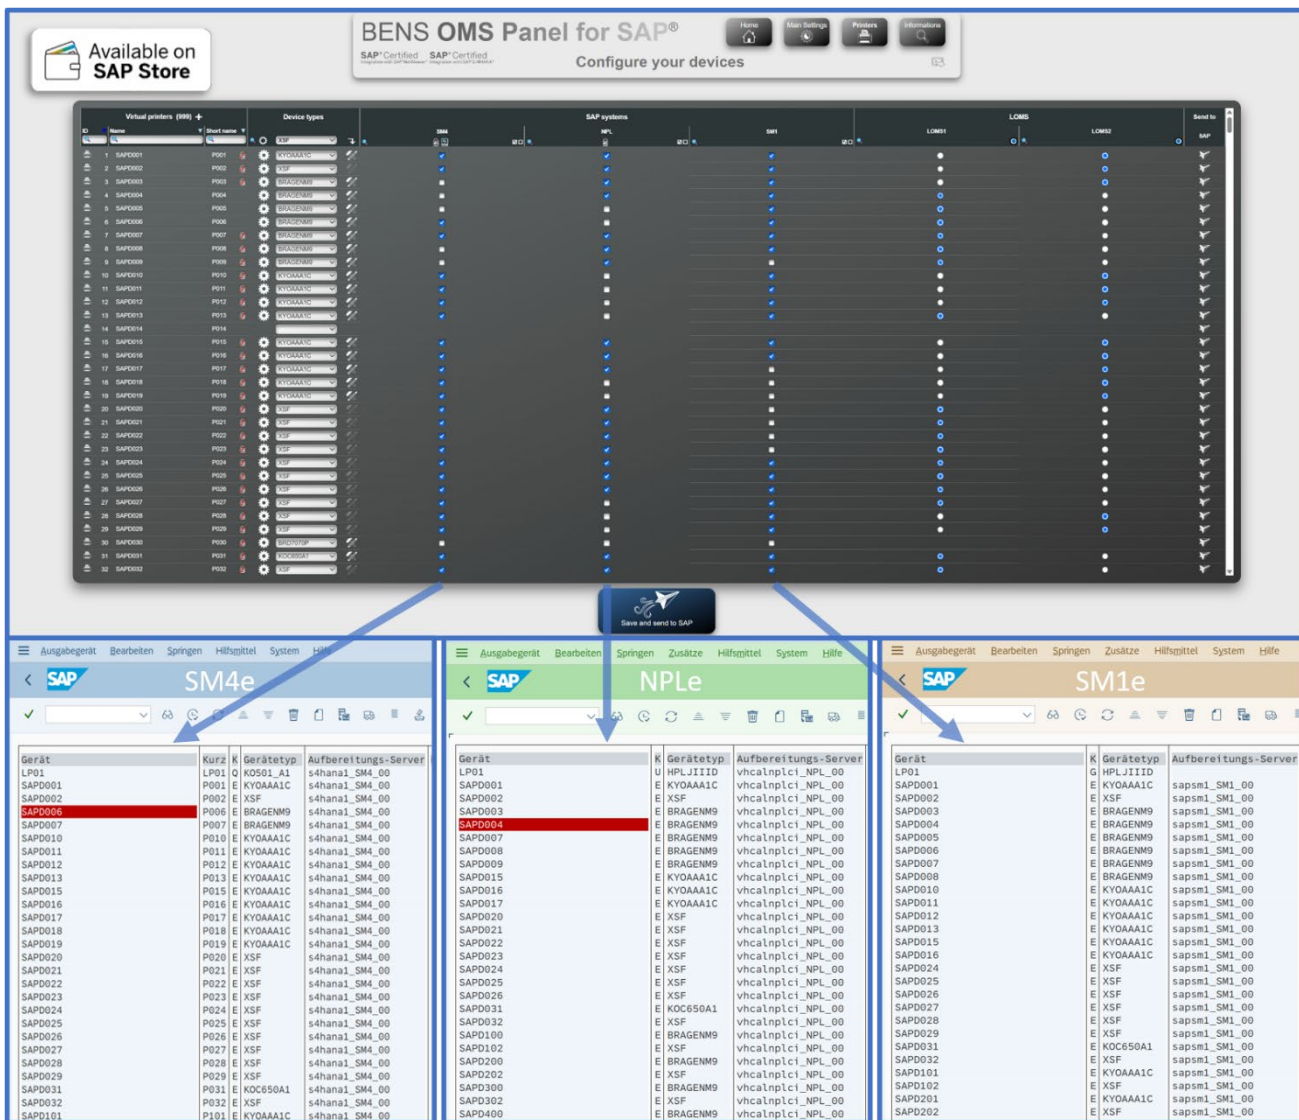

Solution for real problems

- **Transparency:** Precise status reports for print jobs down to printer level.
- **Error detection:** Problems are identified and reported immediately.
- **Efficiency:** Printer configuration with the BENS OMS PANEL saves time and reduces complexity.
- **Reliability:** Stable and precise communication with SAP systems and target devices.
- **Scalability:** Additional SAP servers and printers can be easily added.
- **Performance:** High processing speed thanks to installation on a virtual server (e.g. VMware, Microsoft HyperV or Proxmox).
- **Flexibility:** Additional plugins allow extended workflows to be implemented.
- **Fail-safe operation:** By using a second server as a 'slave' with a so-called floating IP address, which is automatically taken over in the event of a failure of the 'master'.
- **Consistency:** The use of BENS OMS PANEL guarantees a uniform definition of all printers on all connected SAP servers.

BENS OMS Panel for SAP®
SAP Certified SAP Certified
Configure your devices

Available on SAP Store

The interface displays a comprehensive overview of printer configurations across multiple SAP systems. The top section provides a high-level view with columns for ID, Name, Device type, and SAP systems. Below this, three detailed panels (SM4e, NPLe, SM1e) show specific printer data, including Gerat, Kufz, K, Geratstyp, and Aufbereitungs-Server. Arrows indicate the flow of data from the top overview to the detailed panels.

Advantages at a glance

- **Process integration:** BENS OMS takes over and controls communication and output processes generated from one or more SAP systems.
- **No SAP knowledge required:** The BENS OMS Panel is an SAP-certified, intuitive web application for synchronous management of printers on multiple SAP servers.
- **Selective processing:** Printers can be filtered according to various criteria and edited in groups via the web-based BENS OMS panel.
- **Early detection of problems:** Problems with printers are detected and reported at an early stage. Print job statuses are reported in detail to the sending SAP server.
- **Encryption of print data:** BENS OMS offers the option of encrypting print data streams on their way from the SAP server to the printer.
- **Recommended architecture:** SAP generally recommends the use of external output management systems.

Core functions

- **Callback-function:** BENS OMS relieves the SAP servers. It automatically sends status information about the print job to the SAP system from which the job originated.

Technical features

- **Plugin extensibility:** Additional functions can be flexibly integrated using modular plug-ins, e.g.:
 - ✓ **Barcode Plugin:** Ensures correct printing of 1D and 2D barcodes.
 - ✓ **Unicode Plugin:** Enables printing of international character sets such as Japanese, Chinese or Thai.
 - ✓ **Custom Plugins:** Custom workflows can be individually implemented.

SAP certification: Trust through standards

- **Tested safety:** The system is officially certified by SAP and guarantees stable operation..
- **Future-proof:** Fully compatible with SAP updates and modern platforms such as SAP Netweaver and SAP S/4HANA.
- **Minimised risk:** Fewer technical disruptions and greater planning reliability.
